UI/UX

Experiment No: 1

Design User personas for a selected Product / System.

Aim: To design user personas for a selected product or system by identifying users needs, goals, behaviors and challenges.

Software Required : Figma.

Theory :

A user persona is a fictional representation of a target user based on research and user data. It includes demographic details, goals, motivations, behaviours and pain points. Personas help designers understand users and create user-friendly Interfaces.

Procedure :

1. Select a product or system.
2. Identify its target audience and collect user Information there.

3 Identify common user characteristics, need and goals.

4 Create personas with names, profiles and brief descriptions.

5 List each persona's goals, expectations and challenges.

6 Define scenarios describing how users interact with the product.

7 Use the personas to guide design decisions.

Outcome :-

User personas were created to understand the target audience and guide user-centered design decisions.

Conclusion :

User personas were designed succesfully to identify user needs and improve the usability of the selected product.

Experiment No: 2

Design a wireframe for an online learning platform.

Aim :- To design a wireframe for an online learning platform containing course listings, video lectures, quizzes and progress tracking.

Software Req :- figma

Theory :

Wireframing is the process of creating a basic visual layout of an applications interface. It defines the placement of elements, navigation and functionality before detailed visual design.

Procedure :

1. Identify the target users and requirements.
2. List the essential features of the platform.

3 Design a homepage with logic, search, and featured courses.

4 create a course listing page with course details and filters.

5 Design a video lecture page with playback controls.

6 Add a quiz interface and progress tracking dashboard.

7. connect the screens using navigation links.

8 Review the wireframe and improve the layout.

outcome :-

A wireframe was created with course listings, video lectures, quizzes and progress tracking.

Conclusion :-

The online learning platform wireframe was designed successfully with a clear layout and user-friendly navigation.

Experiment No: 3

Design a social fitness App.

Aim : To create wireframes and an interactive prototype for a social fitness app that supports workout tracking, goal setting and social interaction.

Software Required : Figma.

Theory :

A social fitness app combines fitness tracking with social features. Wireframes define the application's layout, while prototypes simulate user interactions and help evaluate the design before development.

Procedure :

1. Identify the target users and app requirements.

2. List features such as workout tracking, goal setting and friend connections.
3. Design a homepage displaying workout summaries and user activity.
4. Create a workout log screen for recording exercises and duration.
5. Design a goal-setting screen to track fitness targets
6. Create a social screen for sharing achievements and connecting with friend and family.
7. Connect the screens to create a clickable prototype.
8. Test the navigation and refine the design.

Outcome :

Wireframes and a clickable prototype were created for workout tracking, goal setting.

Conclusion:

A social fitness app prototype was designed successfully to support fitness tracking and improve user engagement.

Experiment No : 4

Design a Product Packaging mockup

Aim :- To create a product packaging mockup using figma with suitable layouts, colors, logos and product visuals.

Software Required : figma

Theory :

Packaging design involves creating attractive and functional packaging that protects the product and communicates its brand identity. An effective design considers visuals appeal usability, target audience and brand consistency.

Proccdure :

1. Select a product and identify its target audience.

2 study the existing packaging designs and competitors.

3 choose suitable dimensions and a packaging layout.

4 Add the product name, logo, tagline and other details.

5 Select appropriate colors, fonts and graphics.

6 Apply design principles such as contrast, alignment and balance.

7 Create a packaging mockup.

8 Preview the design from different angles and make improvements in them.

outcome :

A product packaging mockup was created with suitable branding elements and visual presentation.

conclusion :-

Product packaging was designed successfully to improve visual

appeal and communicate the products brand identity.

Experiment :- 5

Improve the UI of a fitness Tracking App using figma

Aim :- To Improve the user Interface of an existing fitness tracking app by focusing on simplicity, clarity and motivational elements.

Software Required : figma

Theory :

User Interface (UI) design focuses on the visual elements through which users interact with an application. A good fitness app interface uses clear navigation, readable text, organized layouts and progress indicators to improve usability and motivation.

* Procedure:

1. Examine the existing fitness tracking app interface.
2. Identify usability problems and areas for improvement
3. Study similar fitness apps for design inspiration
4. Create wireframes for the dashboards, workout log and progress tracker.
5. Simplify navigation and organize interface elements.
6. Choose suitable colors, fonts and consistent design components.
7. Add progress charts, achievement badges and motivational elements.
8. Create redesigned screens in Figma and review their usability.

outcome

An Improved fitness tracking app interface was designed with clearer navigation, better progress visualization, and motivational features

Conclusion:

The fitness tracking app interface was redesigned successfully to improve usability clarity and user engagement.
